                                                                                                                                                                                                            ö
                        The sequences given in AAR26448 and AAR26449 are encoded by genes which were used in the construction of an expression plasmid pMONI1030 which was used to transform petunia plants. This plasmid contained the genes for chloroplast transit peptide (CTP2) (AAR26448) and the CP4 synthetic 5-enolpyruvy-3-shikimate phosphate synthetase (EPSPS) gene (AAR26449) which is capable of conferring resistance to glyphosate. The plasmid also contained the 1-aminocyclo-propane-1-carboxylic acid (ACC) transformed plants had ethylene levels reduced to about one half that of the control, untransformed plants. It is expected that such plants will show reduced senesence of flowers and leaves when compared to

This sequence represents the synthetic CP4 5-enolpyruvyl-3-shikimate phosphate synthase (EPSPS) gene which is capable of conferring resistance to glyphosate and is used in a novel method for producing fruit-bearing plants with delayed ripening. The method involves the expression of a 1-aninocyclopropane-1-carboxylic acid (ACC) deaminase gene in a plant at a level sufficient to reduce ethylene production in

5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) activity of the plant
and having at least one enzymatic activity selected from:
(1) EPSPS activity different from natural EPSPS activity of the plant or
(2) glyphosate oxidoreductase (GOX) activity different from the natural
GOX activity of the plant; and in which a gene encoding a protein having
the following properties: (a) combines specifically with a substance
participating to the herbicidic activity a herbicide of
protoporphyrinogen IX oxidase inhibiting type; (b) has substantially no
denaturing activity on a substance to which said protein combines
specifically; and (c) contains substantially no framework region of the
Petunia hybrida EPSPS chloroplast transit peptide and the Agrobacterium

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence is that of the Class II 5'-enolpyruvylshikimate-3 phosphate synthase enzyme (EPSPS) of Agrobacterium sp. strain CP4 It is used to create glyphosate resistant plants or seeds which can be planted in a field of crops to selectively control weeds. The crops selected for are e.g. corn, wheat, rice, oilseed rape, cobacco and alfalfa. This provides a cost effective, environmentally compatible weed control device. See also AAR22301 and AAR22302.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9

An isolated 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) has the sequence domains (I), (III) and (IV): -R-XI-H-X2-E- (I), (GD-K-X3-(II); S-A-Q-X4-K- (III); and -N-X5-T-R- (IV). Where X5 T, C, Y, N, Q, D Or E; X2 and X3 = S Or T; X4 and X5 = A, R, N, D, C, E; X2 and X3 = S or T; X4 and X5 = A, R, N, D, C, E, K, M, F, P, S, T, W, Y or V. The EPSPS enzyme, produced by recombinant methods, can be used in kinetic studies to determine Ki and Km values of the production of 5-enolpyruvyl.3-enzyme is normally used for the production of 5-enolpyruvyl.3-phosphoshikimic acid in plants, and most forms of the enzyme are

Class II EPSPS enzymes are tolerant to glyphosate herbicides. EPSPS and sequences encoding it are used for the production of herbicide resistant (glyphosate-tolerant) plants such as corn, wheat, rice, barley, soybean, cotton, sugarbeet, oilseed rape, canola, flax, sunflower, potato, tobacco, tomato, alfalfa, poplar, pline, eucalyptus, apple, lettuce, peas, lentils, grape and turf grasses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240

inhibited by N-phosphonomethylglycine ('glyphosate') herbicides.
Inhibition data enables more accurate values of concentrations of herbicide to be used when growing the plant without being detrimental to it. This enables the plant to be grown in the presence of the herbicide, being used to inhibit the growth of undesired plants. The present sequence represents a Class II EPSPS from bacterial isolate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

genomic DNA encoding 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) enzyme referred to as class II EPSPS enzyme which is tolerant to glyphosate. EPSPS genes are useful in producing transformed bacteria and transgenic plants which are tolerant to glyphosate herbicide. The probe is useful for identifying the presence of a target genomic DNA encoding a EPSPS enzyme. The present sequence is Agrobacterium sp. strain CP4 class II EPSPS protein.

Note: The present sequence, SED ID NO: 3 is stated as amino acid sequence throughout the specification. However, it is referred as probe in claim 3 of the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Glyphosate tolerant bacteria; herbicides; glyphosate resistant plants; 5'-enolpyruvylshikimate-3-phosphate synthase; weed control.

                                                                                                                                                                                 The sequence is that of the Class II 5'-enolpyruvylshikimate-3 phosphate synthase enzyme (EPSPS) of Achromobacter sp. strain LBAA lit is used to create glyphosate resistant plants or seeds which can be planted in a field of crops to selectively control weeds. The crops selected for are e.g. corn, wheat, rice, oilseed rape, tobacco and alfalfa. This provides a cost effective, environmentally compatible weed control device. See also AAR22300 and AAR22300.

                                                                                                                                                                                                                                                                                                                                                                The sequence is that of the Class II 5'-enolpyruvylshikimate-3 phosphate synthase enzyme (EPSPS) of pseudomonas sp. strain PG2982 lt is used to create glyphosate resistant plants or seeds which can be planted in a field of crops to selectively control weeds. The crops selected for are e.g. corn, wheat, rice, oilseed rape, tobacco and alfalfa. This provides a cost effective, environmentally compatible weed control device. See also AAR22300 and AAR22301.

C. 5-enolpyruvylshikimate-3-phosphate synthases (EPSPS). These novel
C. 5-enolpyruvylshikimate-3-phosphate synthases (EPSPS). These novel
C. 5-enolpyruvylshikimate-3-phosphate synthases (EPSPS). These novel
C. EPSPS enzymes have little homology with known class IEPSPS enzymes, and
C. EPSPS enzymes are part of the
C. C. Compounds. EPSPS corverts phosphoenolpyruvic acid (PEP) and
C. Shikimic acid pathway, which leads to the biosynthasis of aromatic
C. Shikimic acid to 5-enolpyruvyl-3-phosphoshikimic acid, and is
Inhibited by the herbicide glyphosate. It would be useful to produce
Inhibited by the herbicides can be applied to selectively kill
C. Stansgenic crops containing alyphosate. It would be useful to produce
Inhibited by the herbicides can be applied to selectively kill
C. Stansgenic crops containing alyphosate. It would be useful to produce
C. Styphosate-containing herbicides can be applied to selectively kill
C. Weeds. The novel EPSPS enzymes exhibit a low Km for PEP and a high Ki for
C. Styphosate-tolerant, and EPSPS enzyme activity is not affected. These
C. Glyshosate-tolerant, and EPSPS enzyme activity is not affected. These
C. C. Shikimic acid pathway. In addition, the EPSPS gene is cloned into a plant
C. Shikimic acid pathway. In addition, the EPSPS gene is cloned into a plant
C. C. target the control of a promoter such as flywort mosaic virus promoter or
C. C. the cauliflower mosaic virus promoter, so that expression is enhanced. 5-enolpyruvylshikimate-3-phosphate synthase; EPSPS; glyphosate; shikimic acid pathway; phosphoenolpyruvic acid; 3-phosphoshikimic acid; 5-enolpyruvyl-3-phosphoshikimic acid; herbicide; transgenic plant; glyphosate resistance gene; glyphosate-tolerance; promoter. from Achromobacter sp. strain LBAA Production of glyphosate-herbicide tolerant plants – using DNA encoding class II 5-enol:pyruvyl:shikimate-3-phosphate synthase Stallings WC; 200..204 /label= characteristic\_region /note= "see AAW34690" 76...29 /label- characteristic\_region /note- "see AAW34691" /label= characteristic\_region /note= "see AAW34693" /label- characteristic\_region /note- "see AAW34692" Padgette SR, Location/Qualifiers AAW34684 standard; Protein; 449 AA. AAW34683-89 represent a new class of glyphosate-tolerant
5-enolpyruvylshikimate-3-phosphate synthases (EPSPS). These novel
5-enolpyruvylshikimate-3-phosphate synthases (EPSPS). These novel
6-belong to a new class, Class II. The present sequence was isolated from
6-belong to a new class, Class II. The present sequence was isolated from
7-belong to a new class, Class II. The present sequence was isolated from
7-belong to a new class, Class II. The present sequence was isolated from
7-belong to a new class II. The present sequence was isolated from
7-belong pathway, which leads to the biosynthasis of aromatic
7-compounds. EPSPS converts phosphoenolpyruvic acid (PEP) and
7-phosphoshikimic acid to 5-enolpyruvyl-3-phosphoshikimic acid, and is
7-phosphoshikimic acid of glyphosate. It would be useful to produce
7-compounds. EPSPS converts phosphoshikimic acid, and is
7-compounds. The nevel EPSPS enzymes exhibit a low Km for PEP and a high Kil
7-compounds. The plant is made
7-compounds. The plant is chosed into a plant
7-compounds. The plant promoter such as figwort mosaic virus promoter.
7-compounds. The plant plant promoter, so that expression is enhanced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240

AAW24479 shows the sequence of a class II 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) enzyme. Class II EPSPS enzymes are tolerant to glyphosate herbicides. EPSPS and sequences encoding it are used for the production of herbicide resistant (glyphosate-tolerant) plants such as corn, wheat, rice, barley, soybean, cotton, sugarbeet, oilseed rape, canola, flax, sunflower, potato, tobacco, tomato, alfalfa, poplar, pine, eucalyptus, apple, lettuce, peas, lentils, grape and turf grasses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          KAMQAMGARIRKEGDTWIIDGVGNGGLLAPEAPLDFGNAATGCRLTMGLVGVYDFDSTFI 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAW24480 shows the sequence of a class II 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) enzyme. Class II EPSPS enzymes are tolerant to glyphosate herbicides. EPSPS and sequences encoding it are used for the production of herbicide resistant (glyphosate-tolerant) plants such as corn, wheat, rice, barley, soybean, cotton, sugarbeet, oliseed rape, canola, flax, sunflower, potato, tobacco, tomato, alfalfa, poplar, pine, eucalyptus, apple, lettuce, peas, lentils, grape and turf grasses.

An isolated 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) has the sequence domains (I), (II), (III) and (IV): -R-XI-H-X2-E- (I), (-G-D-XX3- (II); -S-A-Q-X4-K- (III); and -N-X5-T-R- (IV), Where XI = G, G, T, C, Y, N, Q, D or E; X2 and X3 = S or T; X4 and X5 = A, R, N, D, C, Q, E, G, H, I, L, K, M, F, P, S, T, W, Y or V. The EPSPS enzyme, produced by recombinant methods, can be used in kinetic studies to determine K1 and Km values of the enzyme for its characterisation. The enzyme is normally used for the production of 5-enolpyruvyl-3-phosphoshikimic acid in plants, and most forms of the enzyme are inhibited by N-phosphonomethylglycine ('glyphosate') herbicides. Inhibition data enables more accurate values of concentrations of herbicide to be used when growing the plant without being detrimental to it. This enables the plant to be grown in the presence of the herbicide, being used to inhibit the growth of undesired plants. The present sequence represents a class II EPSPS from bacterial isolate
   useful for characterisation of the enzyme to determine inhibition
                                                                                            Disclosure; Fig 5; 152pp; English

Mayes S.R., dalla Chiesa M., Zhang Z., Barber J.;
The genes arch and trn0 are located upstream of psb0 in the chromosome of Synechocystis 6803.";
FEBS Lett. 325:255-261(1993).
-!-CATALYITC ACTIVITY: Phosphoenolpyruvate + 3-phosphoshikimate - phosphate + 5-O-(1-carboxyviny)-3-phosphoshikimate.
-!- PATHWAY: SIXTH STEP IN THE BIOSYNTHESIS OF CHORISMATE WITHIN THE BIOSYNTHESIS OF AROMATIC AMINO ACIDS (THE SHIKIMATE PATHWAY).
-!- SUBUNIT: MONOWER (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: CYtoplasmic (Probable).
-!- SIMILARITY: BELONGS TO THE EPSP SYNTHASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         254

Nature 188:539-547(1997).

-!- CATALYTIC ACTIVITY: Phosphoenolpyruvate + 3-phosphoshikimate phosphate + 5-0(1-carboxyvinyl)-3-phosphoshikimate.

-!- PATHMAX: SIXTH STEP IN THE BIOSYNTHESIS OF CHORISMATE WITHIN THE BIOSYNTHESIS OF AROMATIC AMINO ACIDS (THE SHIKIMATE PATHWAY).

-!- SUBUNIT: MONOMER (BY SIMILARITY).

-!- SUBCELLULAR LOCATION: ÇYtoplasmic (Probable).

-!- SIMILARITY: BELONGS TO THE EPSP SYNTHASE FAMILY.
                                                                                                                                                                                                                                                                                315

  The sequence is that of the Class II 5'-enolpyruvylshikimate-3 phosphate synthase enzyme (EPSPS) of Agrobacterium sp. strain CP4 It is used to create glyphosate resistant plants or seeds which can be planted in a field of crops to selectively control weeds. The crops selected for are e.g. corn, wheat, rice, oilseed rape, tobacco and alfalfa. This provides a cost effective, environmentally compatible weed control device. See also AAR22301 and AAR22302.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAW24474 shows the sequence of a class II 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) enzyme. Class II EPSPS enzymes are tolerant to glyphosate herbicides. EPSPS and sequences encoding it are used for the production of herbicide resistant (glyphosate-tolerant) plants such as corn, wheat, rice, barley, soybean, cotton, sugarbeet, oilseed rape, canola, flax, sunflower, potato, tobacco, tomato, alfalfa, poplar, pine, eucalyptus, apple, lettuce, peas, lentils, grape and turf grasses.

An isolated 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) has the sequence domains (I), (III) and (IV): -R-X1-H-X2-E- (I), (5-6-D-K-X3- (II): -S-A-O-X4-K- (III); and -N-X5-T-R- (IV). Where XI = G, S, T, C, Y, N, Q, D or E; X2 and X3 = S or T; X4 and X5 = A, R, N, D, C, C, E, G, H, I, L., K, M, F, P, S, T, W, Y or V. The EPSPS enzyme, produced by recombinant methods, can be used in kinetic studies to determine X1 and Xm values of the enzyme for its characterisation. The enzyme is normally used for the production of 5-enolpyruvyl-3-phosphoshikimic acid in plants, and most forms of the enzyme are inhibited by N-phosphonomethylglycine ('glyphosate') herbicides. Inhibition data enables more accurate values of concentrations of herbicide to be used when growing the plant without being detrimental to herbicide to be used when growing the plant without being detrimental to being used to inhibit the growth of undesired plants. The present sequence represents a class II EPSPS from bacterial isolate
                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               300

                                                                                                                                                                                                                                                                                              The present invention relates to a DNA probe capable of use in a polymerase chain reaction for identifying the presence of a target genomic DNA encoding 5-enolpyruvylahkinate-3-phosphate synthase (EPSPS) encayme referred to as class II EPSPS enzyme which is tolerant to glyphosate. EPSPS genes are useful in producing transformed bacteria and transgenic plants which are tolerant to glyphosate herbicide. The probe is useful for identifying the presence of a target genomic DNA encoding a EPSPS enzyme. The present sequence is Agrobacterium sp. strain CP4 class II EPSPS protein.

Note: The present sequence, SED ID NO: 3 is stated as amino acid sequence throughout the specification. However, it is referred as probe in claim 3 of the specification.
                                                                                                                                                                                                                   DNA probe capable of use in a polymerase chain reaction for identifying the presence of a target genomic DNA encoding a 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) enzyme -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     180

```
phosphate synthase (EPSPS) gene which is capable of conferring resistance to glyphosate and is used in a novel method for producing fruit-bearing plants with delayed ripening. The method involves the expression of a 1-aminocyclopropane-1-carboxylic acid (ACC) deaminase gene in a plant at a level sufficient to reduce ethylene production in the fruit.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequences given in AAR26448 and AAR26449 are encoded by genes which were used in the construction of an expression plasmid pMoNI1030 which was used to transform petunia plants. This plasmid contained the genes for chloroplast transit peptide (CTP2) (AAR264448) and the CP4 synthetic 5-enolpyruvyl-3-shikimate phosphate synthetase (EPSES) gene (AAR26449) which is capable of conferring resistance to glyphosate. The plasmid deaminase gene from Pseudomonas chlorophis (see also AAQ27199). The transformed plants had ethylene levels reduced to about one half that of the control, untransformed plants. It is expected that such plants will show reduced senesence of flowers and leaves when compared to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 KAMQAMGARIRKEGDTWIIDGVGNGGLLAPEAPLDFGNAATGCRLTMGLVGVYDFDSTFI 120

(2) glyphosate oxidoreductase (GOX) activity different from the natural GOX activity of the plant; and in which a gene encoding a protein having the following properties: (a) combines specifically with a substance participating to the herbicidic activity a herbicide of protoporphyrinogen IX oxidase inhibiting type; (b) has substantially no denaturing activity on a substance to which said protein combines specifically; and (c) contains substantially no framework region of the variable region of immunoglobulin. The present sequence is that of the Petunia hybrida EPSPS chloroplast transit peptide and the Agrobacterium sp. strain CP4 EPSPS gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Glyphosate tolerant bacteria; herbicides; glyphosate resistant plants; 5'-enolpyruvylshikimate-3-phosphate synthase; weed control.

                                                                                                                  The sequence is that of the Class II 5'-enolpyruvylshikimate-3 phosphate synthase enzyme (EPSPS) of Achromobacter sp. strain LBAA It is used to create glyphosate resistant plants or seeds which can be planted in a field of crops to selectively control weeds. The crops selected for are e.g. ccnn, wheat, rice, oilseed rape, tobacco and alfalfa. This provides a cost effective, environmentally compatible weed control device. See also AAR22300 and AAR22302.

The crops selected for are e.g. corn, wheat, rice, oilseed rape, tobacco and alfalfa. This provides a cost effective, environmentally compatible weed control device. See also AAR22300 and AAR22301.

5 -enolpyruvylshikimate-3-phosphate synthases (EPSPS). These novel

5 -enolpyruvylshikimate-3-phosphate synthases (EPSPS). These novel

6 -elong to a new class, Class II. The present sequence was isolated from

6 -elong to a new class, Class II. The present sequence was isolated from

6 -elong to a new class, Class II. The present sequence was isolated from

6 -elong to a strain LBAA. The EPSPS enzymes are part of the

7 -enolpyruvyl and the barb of the blosynthesis of aromatic

6 -enolpyruvyl-3-phosphoshikimic acid, and is

7 -enolpyruvyl-3-phosphoshikimic acid, and is

7 -enolpyruvyl-3-phosphoshikimic acid, and is

8 -enolpyruvyl-3-phosphoshikimic acid, and is

8 -enolpyruvyl-3-phosphoshikimic acid, and is

8 -enolpyruvyl-3-phosphoshikimic acid, and is

9 -enolpyruvyl-3-phosphoshikimic acid, and is

8 -enolpyruvyl-3-phosphoshikimic acid, and is

9 -enolpyruvyl-3-phosphoshikimic acid align expirate, and enolpyruvyl-3-phosphoshikimic acid pathway. In addition, the plant, the plant is made

9 -enolpyruvyl-3-phosphoshikimic acid pathway. In addition, the EPSPS gene is cloned into a plant

6 -enolpyruvyl-3-phosphoshikimic acid pathway. In addition, the EPSPS gene is cloned into a plant

7 -enolpyruvyl-3-phosphoshikimic acid pathway. In addition, the EPSPS gene is cloned into a plant

8 -enolpyruvyl-3-phosphoshikimic acid pathway. In addition, the EPSPS gene is cloned into a plant

9 -enolpyruvyl-3-phosphoshikimic acid pathway. In addition, the EPSPS gene is cloned into a plant

9 -enolpyruvyl-3-phosphoshikimic acid pathway. In addition, the EPSPS gene is cloned into a plant

9 -enolpyruvyl-3-phosphoshikimic acid pathway. In addition, the EPSPS gene is cloned into a plant

9 -enolpyruvyl-3-phosphoshikimic acid pathway. In addition, the EPSPS gene is cloned into a plant

9 -enolpyruvyl-3-phosphoshikimic acid pathway. In 
                                                                                                                                                                                                                                                   5-enolpyruvylshikimate-3-phosphate synthase; EPSPS; glyphosate; shikimic acid pathway; phosphoenolpyruvic acid; 3-phosphoshikimic acid; 5-enolpyruvyl-3-phosphoshikimic acid; herbicide; transgenic plant; glyphosate resistance gene; glyphosate-tolerance; promoter.
                                                                                                                                                                                              Class II EPSP synthase (EPSPS) from Achromobacter sp. strain LBAA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Production of glyphosate-herbicide tolerant plants - using DNA encoding class II 5-enol:pyruvyl:shikimate-3-phosphate synthase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Stallings WC;

glyphosate-tolerant, and EPSPS enzyme activity is not affected. These class II EPSPs enzymes are fused to a chloroplast transit peptide to target the protein into the chloroplast, which is the site for the shikimic acid pathway. In addition, the EPSPs gene is cloned into a plant under the control of a promoter such as figwort mosaic virus promoter or the cauliflower mosaic virus promoter, so that expression is enhanced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   AAW34683-89 represent a new class of glyphosate-tolerant EPSPS enzymes have little homology with known class i EPSPS enzymes, and belong to a new class, Class II. The present sequence was isolated from Pseudomonas sp. strain PG2982. The EPSPS enzymes are part of the Pseudomonas sp. strain PG2982. The EPSPS enzymes are part of the Pseudomonas sp. strain PG2982. The EPSPS enzymes are part of the Spilkimic acid pathway, which leads to the biosynthesis of aromatic compounds. EPSPS converts phosphoenolpyruvic acid (PEP) and 3-phosphoshkimic acid to 5-enolpyruvyl-3-phosphoshkimic acid, and is inhibited by the herbicide glyphosate. It would be useful to produce transgenic crops containing dlyphosate. It would be useful to produce transgenic crops containing dlyphosate resistance genes so that glyphosate. The novel EPSPS enzymes exhibit a low Km for PEP and a high Ki for all phosphosphosphisms and a phosphosphosphosphism introduced into a plant, the plant is made
                                                                                                                                                                                                                                                                                                                     Production of glyphosate-herbicide tolerant plants - using DNA encoding class II 5-enol:pyruvyl:shikimate-3-phosphate synthase
                                                                                                                                                                                                          Stallings WC;

for

AAW24479 shows the sequence of a class II 5-enolpyruvylshikimate-3-phosphate synthase (EPSPS) enzyme. Class II EPSPS enzymes are tolerant to glyphosate herbicides. EPSPS and sequences encoding it are used for the production of herbicide resistant (glyphosate-tolerant) plants such as corn, wheat, rice, barley, soybean, cotton, sugarbeet, oilseed rape, canola, flax, sunflower, potato, tobacco, tomato, alfalfa, poplar, pine, eucalyptus, apple, lettuce, peas, lentils, grape and turf grasses. 449 AA; Sequence

AAW24480 shows the sequence of a class II 5-enolpyruvylshikimate-3-phosphate synthase (ERSPS) enzyme. Class II ERSPS enzymes are tolerant to glyphosate herbicides. ERSPS and sequences encoding it are used for the production of herbicide resistant (glyphosate-tolerant) plants such as corn, wheat, rice, barley, soybean, cotton, sugarbeet, oilseed rape, canola, flax, sunflower, potato, tobacco, tomato, alfalfa, poplar, pine, eucalyptus, apple, lettuce, peas, lentils, grape and turf grasses.
